A brief history of solar thermal power generation

Overview

The chapter attempts to briefly show the general features of the sun which offers the input power to all solar thermal systems followed by early applications from the prehistoric times and a general overview of the current status of installed renewable energy systems in the world. Its history spans from the 7th Century B. We started out concentrating the sun's heat with glass and mirrors to light fires. Today, we have everything from solar-powered buildings to solar-powered vehicles. Here you can learn more about the milestones in the historical development of. The first three units of Solnova in the foreground, with the two towers of the PS10 and PS20 solar power stations in the background.

Where temperatures below about 95 °C (200 °F) are sufficient, as for space heating, flat-plate collectors of the nonconcentrating type are generally used. Because of the relatively high heat losses through the glazing, flat plate collectors will not reach temperatures much above 200 °C (400 °F) even when the heat transfer fluid is stagnant. Such temperatures are too low for efficient conversion to electricity.
