Base station power supply load current

Overview

Referring to the load curve of Fig. 13, it is clear that 20 MW of load has to be supplied by the station at all times of day and night. Modern FPGAs and processors are built using advanced nanometer processes because they often perform calculations at fast speeds using low voltages (<0.9 V) at high current from compact. An integrated architecture reduces power consumption, which MTN Consulting estimates currently is about 5% to 6% of opex. This percentage will increase significantly with 5G because a gNodeB uses at least twice as much electricity as a 4G base station.
