## Overview

---

Farmers can benefit from solar energy in several ways—by leasing farmland for solar; installing a solar system on a house, barn, or other building; or through agrivoltaics. Agrivoltaics is defined as agriculture, such as crop production, livestock grazing, and pollinator habitat, located underneath. This is due to the shade cover from the surrounding, elevated solar panels or land-like the impact of surrounding trees. Land developers should seek large, open, flat pieces of land for their solar sites to avoid these impacts on energy production. By establishing clear guidelines for solar development, municipalities can create frameworks that benefit both. This guide provides an overview of the site-specific planning and implementation steps needed to build an agrivoltaic project on your farm. A solar land lease can provide an additional revenue stream for landowners with minimal effort.
