Health effects from the radio-frequency radiation emitted by cell towers is documented in peer-reviewed research and includes increased cancer risk, headaches, sleep issues, genetic damage, changes to the reproductive system, memory deficits, impacts to the nervous system and. “In recent years, concern has increased about exposure to radio frequency electromagnetic radiation emitted from cell phones and phone station antennae. An Egyptian study confirmed concerns that living nearby mobile phone base stations increased the risk for developing: Short-term exposure to these. As mobile technology advances and cell towers continue to multiply across cities and neighborhoods, a rising number of scientists and health professionals are raising concerns about the long-term effects of EMF (electromagnetic field) exposure. Understanding the scientific consensus on the energy they emit is necessary as cellular infrastructure becomes common. This discussion examines the physics of cell. A recent study published in *Ecotoxicology and Environmental Safety* examined genetic changes that took place in otherwise healthy adults after at least 5 years of living near cell phone towers in Germany.
