Changes in the way solar power is connected to the grid

Overview

While solar panels generate DC electricity, the grid operates using AC (alternating current) electricity. An inverter is needed to convert the electricity so that it can be used by the grid. For most of the past 100 years, electrical grids involved large-scale, centralized energy generation located far from. Each solar panel contains multiple photovoltaic (PV) cells that capture sunlight and convert it into DC (direct current) electricity. There's a lot of equipment involved in producing and delivering electricity over vast distances, and every once in a while, things break. But this. As more people are going solar, utility companies are using programs like net metering to help integrate solar power and the grid.
