Flywheel energy storage generator output voltage

Overview

Flywheel systems in service today demonstrate millisecond response times, energy storage up to 700 kWh per rotor, power output of up to 500 MW per rotor, and decades of service life. The flywheels summarized here have generally been deployed in stationary applications. When energy is extracted from the system, the flywheel's rotational speed is reduced as a consequence of the principle of conservation of energy; adding energy to the. Flywheel Energy Storage Systems (FESS) rely on a mechanical working principle: An electric motor is used to spin a rotor of high inertia up to 20,000-50,000 rpm. For discharging, the motor acts as a generator, braking the rotor to. Flywheel generators are emerging as a prominent solution in backup power and energy storage. Each unit employs a 2,000 lb carbon/glass composite rotor spinning in a vacuum with a surface speed of up to 600 m/s. The units are mounted below grade. Due to the highly interdisciplinary nature of FESSs, we survey different design.
