## Overview

---

A 5 to 10 kWh battery is a good fit for average American homes, especially those with solar panels. It allows you to store enough energy to cover evening and overnight needs without drawing as much from the grid, which can lower your electricity bills noticeably. Power and energy requirements are different: Your battery must handle both daily energy consumption (kWh) and peak power demands (kW). Future electrification significantly impacts. Home batteries store electricity from your solar system or the grid for use during outages, when the grid is most expensive, or at night when it is dark. A well-sized system can keep essential appliances running, lower your utility bill and protect you from grid disruptions.
