How can solar power be generated at night

Overview

No, standard solar panels don't produce electricity during the night since they require sunlight to do that but new technology such as anti-solar panels and radiative cooling PV cells, can generate a little bit of power in the dark by converting radiation from heat into electricity. Thanks to a new breakthrough, this is no longer a fantasy — scientists have created a photovoltaic (PV) cell that is able to generate power at night through a process known as radiative cooling. Rather than drawing power from the sun, the panel absorbs heat emanating from its own surface as. Is there a way to get solar energy at night?

Solar-thermal collectors are able to keep the plant running after the sun has gone down. See more green science pictures. With their large temperature differences between day and night, deserts make ideal locations for thermoradiative diodes, which generate electricity when they are hotter than their surroundings. Unlike photovoltaic and thermal solar panels, which use active cooling mechanisms, most nocturnal panels employ a passive cooling mechanism (radiative cooling) to keep the colder part of the thermoelectric generator several degrees below the ambient temperature, so that the air can heat the other. This has always been a limitation for solar power systems, especially in areas with frequent cloudy days or long nights. This stored energy is accumulated during the day when the panels are exposed to sunlight.
