How to cool down solar inverter quickly

Overview

Solar inverters can be cooled in one of two ways: by using a passive cooling system or through active cooling. Passive or natural cooling means that the inverter's cooling fin dissipates heat without the need for a fan. As a solar technician, I want to show you the simple checks and fixes I use every day to keep inverters cool and running at peak performance. The first thing you need to remember is to install the solar inverter in a well-ventilated area. Nowadays solar power is doing more than ever to help meet energy demands for local power and for.
