Low utilization rate of new energy storage projects

Overview

Recent data shows a troubling gap: while global renewable generation capacity reached 3,870 GW in Q2 2023, storage systems only utilized 68% of captured energy on average. Adding more energy storage could have benefits, like helping utilities Meet demand during supply disruptions Recover faster after outages Support renewable energy by storing power when natural sources—like wind and sunlight—are abundant and releasing it when they are not But it can be hard to put. The Department of Energy's (DOE) Energy Storage Grand Challenge (ESGC) is a comprehensive program to accelerate the development, commercialization, and utilization of next-generation energy storage technologies and sustain American global leadership in energy storage. The program is organized. Battery-based energy storage capacity installations soared more than 1200% between 2018 and 1H2023, reflecting its rapid ascent as a game changer for the electric power sector. High utilization rates can lead to improved operational efficiency and cost savings, directly impacting financial health. This study proposes a shared energy storage strategy for renewable energy station clusters to address fossil fuel dependence and support the green energy.
