# **Photovoltaic panel roof load standard**

## Overview

---

ASCE 7 and Eurocode are the principal standards that provide engineers with the methodologies to calculate these loads. For installers, engineers, and property owners, understanding the structural load requirements for rooftop photovoltaic (PV) systems is critical. When calculating the necessary load capacity of a roof, you need to figure in what's known as the dead load along with live loads or environmental loads. This document does not address solar towers, roof-mounted. This blog will aim to answer several questions related to evaluating solar panel damage and liability claims such as whether the code has information on solar panel loading and requirements (spoiler alert – yes!) and when and where a design professional is recommended for solar panel installation. Find out how the ASCE 7 standard affects wind load, seismic load, and tornado load considerations for solar photovoltaic (PV) systems. At SEAC's February general meeting, Solar Energy Industries Association Senior Director of Codes and Standards Joe Cain presented an update on structural load. 120 mph and ground snow load no greater than 10 pdf).

### Updates on ASCE 7 Standard for Solar PV Systems

ASCE 7-16 For PV Systems  
Changes in ASCE 7-22  
Code Development Issues  
Informational Resources  
The 2016 edition of ASCE 7 has been in effect for about three years. It has three more years remaining before the standard is superseded by ASCE 7-22. ASCE 7-16 introduced substantial increases in the component and cladding pressure coefficients used to calculate wind pressure in various wind zones. This change had a big impact on rooftop...
