## Overview

---

The PV cell is composed of semiconductor material; the “semi” means that it can conduct electricity better than an insulator but not as well as a good conductor like a metal. While most of us talk about solar panels as giant mirrors, the real magic happens at the atomic level, where photons collide with semiconductor lattices to create charge carriers. By exploring the. When light shines on a photovoltaic (PV) cell – also called a solar cell – that light may be reflected, absorbed, or pass right through the cell.
