Simple detection report of photovoltaic panel ground wire

Overview

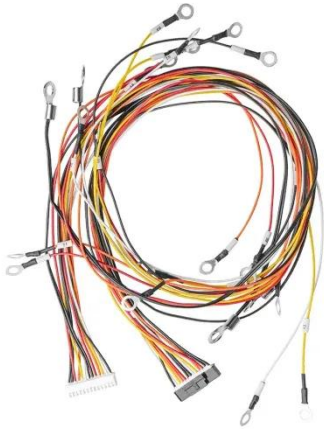

This report provides field procedures for testing PV arrays for ground faults, and for implementing high-resolution ground fault and arc fault detectors in existing and new PV system designs. This report is available at no cost from the National Renewable Energy Laboratory (NREL) at www.nrel.gov. A ground fault occurs when a normally current-carrying electrical conductor, such as a positive or negative wire in a solar array, comes into contact with grounded metal components of the system, like the racking or conduit. Is the fault inside a module?

Along a wire run?

In a connector?

The key to locating the fault efficiently, without dismantling the entire array, is using voltage measurements and some basic. If left undetected, ground faults can lead to inverter shutdowns, loss of system yield, or even fire. It can identify the ground fault, generate an error code, and shut down the inverter.
