Why does power supply have a negative rail if can only output positive

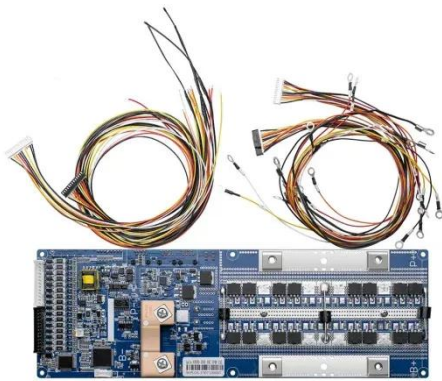

According to the datasheet of this power supply, the output voltage goes from 0~60 VDC. If the output can't be negative, why does it have a negative rail beside ground?

What exactly is voltage?

The total voltage you get from one out and back, even with a high temperature difference is pretty small. By putting many of these out and back

combinations together, you can get a useful voltage. A single ...

operational amplifier

This treats the potentiometer as a basic voltage divider between the supply rails. My questions: Is this expression for the non-inverting input valid? How can I derive the complete output ...
