What kind of thick wire is used for uninterrupted power supply of communication base station

Overview

THWN-2 wire is an improved wire with thicker insulation that is both high heat and water resistant. It can be used for indoor and outdoor locations and withstand dry and wet temperatures up to 194 °F or 90 °C. The transport of electricity from substations to distribution transformers is the primary purpose of primary wire, designed to operate at voltages significantly higher than those in other wires and cables. Such a wire can carry increased electrical loads; hence, it is not uncommon to see it. This guide is intended to assist code authorities, installers and contractors in determining the suitability of UL Certified, Listed, Classified and Verified wire and cable for use in a specific installation. A good conductor should have the following properties: Conductor Materials Copper was the preferred material for overhead conductors in earlier days, but. Power Cable Definition: A power cable is defined as an assembly of insulated electrical conductors used for transmitting and distributing electrical power. In the electric sector, electric wires and cables play a key role in transmitting & distributing power to industries, houses, offices, etc. Electrical wire insulation prevents electrical contact with other conductors, protects people.
