Why are there so many photovoltaic inverters

Overview

Inverters belong to a large group of static converters, which include many of today's devices able to “convert” electrical parameters in input, such as voltage and frequency, so as to produce an output that is compatible with the requirements of the load. A solar inverter or photovoltaic (PV) inverter is a type of power inverter which converts the variable direct current (DC) output of a photovoltaic solar panel into a utility frequency alternating current (AC) that can be fed into a commercial electrical grid or used by a local, off-grid electrical. A solar power inverter converts or inverts the direct current (DC) energy produced by a solar panel into Alternate Current (AC.) Most homes use AC rather than DC energy. DC energy is not safe to use in homes.
