Wind flies to generate electricity

Overview

Flying massive kites 200 meters or more above the ground, companies are using the wind they find there to generate electricity. A project in Co Mayo is generating renewable electricity through the flying of kites, which its operator has described as a potential "game changer" in the wind energy sector. It is being conducted on a bogland just outside Bangor Erris, located on a landscape one might expect in a Star Wars. By reaching stronger, more consistent winds at higher altitudes, these energy kites promise greater efficiency, reduced environmental impact, and a less intrusive presence on the landscape, marking a. Steered by a computer to loop in the wind, this kite converts wind energy into electricity via a tether attached to a generator on the ground.
