Wind turbine designs

Overview

Wind turbine design is the process of defining the form and configuration of a turbine to extract energy from the wind. An installation consists of the systems needed to capture the wind's energy, point the turbine into the wind, convert it into electricity, and other systems to start, stop, and control the turbine. In 1919, German physicist Albert Betz showed that for a hypothetical ideal wind-energy converter, the maximum power that can be extracted from the wind is limited to 16/27 of the total power available in the wind.
